2018 Communication Technology Update and Fundamentals: Automotive Telematics

Prof. Denise Belafonte-Young MFA
Lynn University
Automotive Telematics

Denise Belafonte-Young, M.F.A.

Why Study Automotive Telematics?
- With road building and road designs, locations are often hard to find. GPS is an integral part of navigating for drivers.
- Leading devices and quick response times can affect a car's safety, as well as the safety of other vehicles, and how drivers properly drive.
- Smart phone apps will provide tight andborn alerts to help and feed cars, on the road, or in the upcoming days, as what time goes on, the development of tech has been a source of communication, and entertainment.

Introduction

Automotive Telematics can be defined as "the blending of computers and wireless telecommunication technologies" (Rajendran, 2006). It is a way for cars to receive information about the location, movement, and state of the vehicle. It also enables vehicles to communicate with one another, which opens up a whole range of services.

Telematics essentially a range of different systems, options, and devices that are brought together by a single principle, data and communication. (Gens, Purnell, & Steffen, 2013). The primary advantage of these types of systems is that it enables cars to communicate with each other. This communication can be used for various purposes, such as safety, entertainment, and navigation.

Evolution of Automotive Telematics

The Birth of the Car Radio

The first automotive telematics were the radio, which was introduced in the early 1900s. It was a simple device that could be used to receive radio stations. According to Gens et al., "The first radio was a novelty in the 1930s, but it wasn't until the 1960s when cars came equipped with AM radios." William Linds, who created the Learphone, also created the first name module, car radio. The first FM
What is Automotive Telematics?

Automotive Telematics can be defined as “the blending of computers and wireless telecommunications technologies”

(Rouse, 2007)
Telematics is essentially a range of different features, options and devices that are brought together by a single principle – data and communication.

Telematics enables you to get information about the location, movement, and state of your vehicle. It also enables your vehicle to communicate wirelessly, which opens up a wide range of services. (Coe, Prime, & Jest, 2014b).
Telematics makes your car safer, keeps you from getting lost, summons roadside assistance at the press of a button, routes you around accidents, and auto-dials 911 if you’re in the accident.

For most users, telematics means navigation, communications, safety, security, and increasing infotainment.
Fleet Management trends

Still on the Rise…

- Self-Driving Cars
- Driverless UBER, car rental, food delivery…etc.
- Smart technology & Connectivity gone mad
- Safety features e.g. Brake sensor technology
Electric Car Charging Stations

Connectivity, Navigation, and Diagnostic Analysis

- GM On-Star system
- The Mercedes Benz mbrace,
- BMW iDrive Vehicle Control System
- Lexus Enform
- Toyota Safety Connect
- Ford Sync
- Hyundai BlueLink
- Infiniti Connection
- Honda Link

5G Technology

How Vehicle-to-Vehicle Communication Could Replace Traffic Lights and Shorten Commutes

Photo: Dan Saelinger
1. Each vehicle computes its own distance to the intersection, the distance of the vehicles approaching the intersection from other directions, and each vehicle’s speed, acceleration, and trajectory. Together they elect one vehicle to serve as the leader for a certain amount of time.

2. The leader vehicle decides which direction has the right-of-way (the equivalent of a green light) and which direction has the red light.

3. The leader assigns the status of a red light to its own direction of movement, while giving the green light to all the cars in the perpendicular flow.

4. After the leader’s time is up, a car in the perpendicular flow becomes the leader and does the same thing. In this fashion, leadership is handed over repeatedly.

That's all the algorithm needs to decide which vehicle gets to go through the intersection (green light) and which has to stop (red light).

Don’t we have this?
“Communication Technology Update and Fundamentals”

Is a great text and/or tool for any emerging media or technology course
The Book is used as a supplemental text in our Communication and Emerging Media Major course:

COM 244- Development of Technology in Communication
In Conclusion...
Keep updated with us…

What’s next?
Thank you!
